

Using Public Wifi? Be aware!

Public Wifi is convenient, but bad actors can abuse it to access your personal data. Here are some tips:

Confirm you're on the correct network - Hackers will make fake wifi network names that look real like St@rbucks_wifi or Sbucks-wifi. Always check you're on the real network by asking an employee or the wifi owner.

Use a VPN - Using a VPN to ensure your data is encrypted and is not visible when it passes through the network.

Avoid accessing sensitive information - It's probably best not to do any online banking or view confidential information when you know you are on an unsecure network.
